# The ifthen package\*

### David Carlisle

2001/05/26

#### Abstract

This file implements an \ifthenelse command for  $\LaTeX 2\varepsilon$ . The algorithm used is compatible with that used in the  $\LaTeX 2.09$  ifthen style option. It has been recoded, making the resulting definitions somewhat more compact and efficient.

#### 1 Introduction

\ifthenelse

```
\left( test \right)  \left( then \ clause \right)  \left( else \ clause \right)
```

Evaluates  $\langle test \rangle$  as a boolean function, and then executes either  $\langle then\ clause \rangle$  or  $\langle else\ clause \rangle$ .

 $\langle test \rangle$  is a boolean expression using the infix connectives, \and, \or, the unary \not and parentheses \(\).

As an alternative notation  $\AND$ ,  $\OR$  and  $\NOT$  can be used. This is safer since it can't be misinterpreted when appearing inside a TEX-conditional in which  $\OR$  has a different meaning.

The atomic propositions are:

```
 \langle number \rangle < \langle number \rangle \\ \langle number \rangle = \langle number \rangle \\ \langle number \rangle > \langle number \rangle \\ \text{\times isodd} \{ \langle number \rangle \} \\ \text{\times ined} \{ \langle command \ name \rangle \} \\ \text{\times ined} \{ \langle dimen \rangle < \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle = \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle > \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle > \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle > \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle > \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times inest} \{ \langle dimen \rangle \} \\ \text{\times in the inest} \{ \langle dimen \rangle \} \\ \text{\times
```

The  $\langle string \rangle$ s tested by **\equal** may be any sequence of commands that expand to a list of tokens. If these expansions are equal, then the proposition is true.

\isodd is true if the  $\langle number \rangle$  is odd, and false otherwise (even if the argument is not a number).

\isundefined{\cmd} is true if \cmd is not defined.

\boolean{xyz} returns the truth value contained in the primitive TEX \if, \ifxyz. This is usually used with boolean flags created with \newboolean and \provideboolean described below. It can also be used with the names of \newif

<sup>\*</sup>This file has version number v1.1c, last revised 2001/05/26.

created tokens, and primitive TEX \if constructs, for example \boolean{true} (\iftrue), \boolean{mmode} (\ifmmode) etc.

The commands:

\newboolean \provideboolean

 $\mbox{\constant} {\name} \$  and  $\provideboolean{\constant} {\name} \$  are provided so the user can easily create new boolean flags. As for  $\new.\$  newboolean generates an error if the command name is not new.  $\provideboolean$  silently does nothing in that case.

The boolean flags may be set with:

\setboolean

 $\sl \langle name \rangle \} \{\langle value \rangle \}$ 

 $\langle value \rangle$  may be either true or false (any CaSe).

Note that there is no precedence between \and and \or. The proposition is evaluated in a left right manner. \not only applies to the immediately following proposition. (This is consistent with Lamport's ifthen.sty.) In this style, though the test is 'lazily' evaluated, so for instance if the first proposition in an \or is true, the second one is skipped. (On the second pass—the first pass in an \edef expands clauses in all propositions.)

Apart from the addition of the extra atomic propositions \isodd, \boolean, \lengthtest and \isundefined, the only known incompatibility is that in this package the expression\not\not $\langle P \rangle$  is equivalent to  $\langle P \rangle$ . However in the original style it was equivalent to  $\langle not \rangle$ . This is intentional (bug fix:-).

\whiledo

The command \whiledo is also defined (copied directly from the LATEX2.09 definition).

 $\whiledo{\langle test \rangle} {\langle while \ clause \rangle}$ 

With  $\langle test \rangle$  as above, repeatedly executes  $\langle while\ clause \rangle$  while the test remains true.

## 2 The Implementation

1 (\*package)

\TE@throw

In order to support the syntax of ifthen.sty, which allows access to the primitive TEX syntax for a numeric test, rather than a {} delimited argument form, it is most convenient to work 'within' an \ifnum. \iffum. \iffum 'throws' you out of the current \ifnum so that you can (eg) start an \ifdim for the length tests.

 $\boolean$ 

A non-standard extension to ifthen, supporting boolean was previously available, this is a simpler implementation.

- 3 \def\boolean#1#2{%
- 4 \TE@throw\expandafter\noexpand\csname if#1\endcsname#2}

\TE@length

Testing lengths. #1 is the test. The extra argument gobbles spaces.

5 \def\TE@length#1#2{\TE@throw\noexpand\ifdim#1#2}

\TE@Godd

Testing odd/even. This is true if #1 is an odd number, and false otherwise (even if #1 is not a number at all).

It is hard to make this completely reliable. Here I have erred on the side of safety. This should not generate a TeX error if given any robust commands as its argument. However it returns true on any argument that *starts* with an

odd number 11xx which is bad, and it can not deal with TEX's count registers, although LATEX counters work (via \value).

- 6 \def\TE@odd#1#2{%
- 7 \TE@throw\noexpand\TE@@odd#1\noexpand\@nil\noexpand\ifodd\count@#2} \TE@@odd is not expanded on the first pass.
- 8 \def\TE@@odd#1#2\@nil{%
- 9 \@defaultunits
- 10 \count@\if-#1-0\else0\expandafter#1\fi#2\relax\@nnil}

\TE@repl replaces the single token #1 by #2. (Not within {} groups.) It is used to replace \or by \TE@or without the need to redefine \or. Earlier versions just \let\or\TE@or but this has a bad effect on the expansion of commands which use the primitive \or internally, eg \alph, and so caused surprising results if these commands were used inside \equal.

```
11 \def\TE@repl#1#2{%
    \long\def\@tempc##1#1##2{%
12
       \def\@tempa{##2}\def\@tempb{\@tempc}%
13
       \ifx\@tempa\@tempb
14
       \toks@\expandafter{\the\toks@##1}%
15
       \expandafter\@gobble
16
17
       \else
         \toks@\expandafter{\the\toks@##1#2}%
18
       \expandafter\@tempc
19
20
      \fi
21
      ##2}%
    \verb|\expandafter\toks@\expandafter{\expandafter}||
22
    \expandafter\@tempc\the\toks@#1\@tempc}
```

\ifthenelse

The remaining macros in this file are derived from the ones in ifthen.sty but recoded and simplified. The main simplification is that the original style (and the \boolean extensions) expressed logical values always in terms of \ifnum. As \fi is 'untyped' this is not necessary, so for example the length tests can return values via \ifdim, the trailing \fi will not complain, even though it was 'expecting' an \ifnum. Also the system of passing information via macros expanding to T or F has been completely replaced by a simpler system using \iftrue, which furthermore allows lazy evaluation on the second pass.

#### 24 \long\def\ifthenelse#1{%

- 25 \toks@{#1}%
- 26 \TE@repl\or\TE@or
- 27 \TE@repl\and\TE@and
- 28 \TE@repl\not\TE@neg

Support alternate names for the boolean operators (strictly speaking only \OR would be necessary).

- 29 \TE@repl\OR\TE@or
- 30 \TE@repl\AND\TE@and
- 31 \TE@repl\NOT\TE@neg

The original ifthen.sty processed everything inside a box assignment, to catch any extra spaces before they appeared in the output. Instead I have added extra arguments to the commands so they each remove any following space.

Set up the user level names \not etc.

```
\begingroup
32
          \let\protect\@unexpandable@protect
33
          \def\@setref##1##2##3{%
34
           \ifx##1\relax\z@\else\expandafter##2##1\fi}%
35
          \def\value##1{\the\csname c@##1\endcsname}%
36
          \let\equal\TE@equal \let\(\TE@lparen \let\)\TE@rparen
37
          \let\isodd\TE@odd \let\lengthtest\TE@length
38
          \let\isundefined\TE@undef
39
```

For the first pass, in a group, make various tokens non-expandable.

It is unfortunate that in order to remain compatible with ifthen syntax, it is necessary to have a two pass system. The first pass inside an \edge 'exposes' the \if... \fi tokens, so the corect clauses may be skipped on the second pass. This means that the whole \ifthenelse command does not work by expansion, and so possibly has only limited usefulness for macro code writers. The main problem with the ifthen: syntax is that (unique for IATEX) it does not uses a brace delimited argument form, and exposes the primitive TEX syntax for  $\langle number \rangle$ . Pretty much the only way of parsing 1 > 2 \or 2 < 1 is to actually evaluate the primitive \ifnums. A syntax such as:

```
\operatorname{\mathbb{1}<2}}{\operatorname{\mathbb{1}}}
```

could easily be evaluated in a one pass way, operating directly via expansion, and leaving no extra tokens in the token stream.

Still, on with the code... make  $\ensuremath{\texttt{Qtempb}}$  tokens non-expandable on the first pass.

```
40 \begingroup
41 \let\@tempa\relax\let\@tempb\relax
42 \xdef\@gtempa{\expandafter\TE@eval\the\toks@\TE@endeval}%
43 \endgroup
```

Now outside the group, execute \@gtempa which causes all the \ifs etc., to be evaluated, the final truth value is contained in the \newif token \ifTE@val. Finally this is tested and either the first or second following argument is chosen accordingly.

```
44 \@gtempa
45 \expandafter\endgroup\ifTE@val
46 \expandafter\@firstoftwo
47 \else
48 \expandafter\@secondoftwo
49 \fi}
```

\TE@eval Initialise a term. (Expanded on the first pass).

 $50 \label{two-pand-temperature} 50 \label{two-pand-temperature} 100 \label{two-pand-temperature}$ 

\ifTE@val \ifTE@negate Two \newifs the first holds the current truth value of the expression. The second is a temporary flag which is true if we need to negate the current proposition.

```
51 \newif\ifTE@val
52 \newif\ifTE@negate
```

\TE@endeval Finalise a term. (Expanded on the first pass).

 $53 \ensuremath{\texttt{Nef}\ensuremath{\texttt{TE@endeval}}\ensuremath{\texttt{Nelax}}}$ 

55 \else

 $\verb|\noexpand\TE@setvalfalse\noexpand| \\$ 

```
Set the \ifTE@val to true or false depending on the value of the current proposi-
  \TE@setvaltrue
                                 tion, and the negate flag. (Not expanded on the first pass.)
\TE@setvalfalse
                                 60 \def\TE@setvaltrue{%
                                 61 \ifTE@negate\TE@valfalse\else\TE@valtrue\fi}
                                 62 \label{lem:condition} 62 \label{lem:condition} 42 \label{lem:condi
                               The internal version of \or. Ends the current term. If true skip the remaining
                  \TE@or
                                  terms.
                                  63 \end{TE@or{\TE@endeval\noexpand\ifTE@val\noexpand\else\noexpand\ifnum}}
               \TE@and
                                The internal version of \and. If false skip the remaining terms.
                                  64 \end{TE0endeval\noexpand\ifTE0val\noexpand\ifnum}
                                 \not. Throw the current context, set a negate flag, then restart the \ifnum.
                                 \TE@negswitch is not expanded on the first pass.
    \TE@negswitch
                                  65 \def\TE@neg{\TE@throw\noexpand\TE@negswitch\noexpand\ifnum}
                                  66 \def\TE@negswitch{\ifTE@negate\TE@negatefalse\else\TE@negatetrue\fi}
                                 \(. Throw the current context, then restart a term inside a group.
         \TE@lparen
                                  67 \def\TE@lparen#1{\TE@throw\begingroup\TE@eval#1}
                                ) end the current term, and the local group started by \( \), but pass on the boolean
         \TE@rparen
                                  value in \if\@val T. The \noexpand stops the \expandafter from expanding on
                                  the first pass.
                                 68 \def\TE@rparen#1{%
                                         \TE@endeval
                                         \noexpand\expandafter\endgroup\noexpand\ifTE@val#1}
                                 \equal greatly simplified from the original. \def may be used rather than \edef
            \TE@equal
                                  as the whole thing is expanded anyway in the first pass. The boolean can be
                                 directly encoded with the \ifx, there is no need to start an equivalent \ifnum.
                                 71 \long\def\TE@equal#1#2#3{\TE@throw
                                                  72
                                                  \noexpand\ifx\@tempa\@tempb#3}
                                 73
        \setboolean
                                 \setboolean takes true or false, as #2, and sets #1 accordingly.
