

Function Problems

- ▶ Write a function `larger`, that takes two same-length lists and returns a new list that contains the larger number in each list at each position.
 - ▶ E.g. `larger([10, 20, 30], [5, 25, 18])` would return `[10, 25, 30]`
- ▶ Write a function `pow`, which takes two numbers and returns the first number raised to the power of the second number. Do not use the built in `math.exp()` function.
 - ▶ E.g. `pow(3, 4)` would return 3^4 which is 81
