

Module 2d: Lecture Problems

Solving for I, Q, and t

Calculate the value of I, Q and t that are used in the shear formula for finding the shear stress at point A.

Module 2d: Lecture Problems

Module 2d: Lecture Problems

Module 2d: Lecture Problems

Example 1

If the wide-flange beam is subjected to a shear of $V=20$ kN, determine the shear stress on the web at A. Indicate the shear-stress components on a volume element located at this point.

Module 2d: Lecture Problems

Example 2

If the T-beam is subjected to a vertical shear of $V = 12$ kip, determine the maximum shear stress in the beam. Also, compute the shear-stress jump at the flange-web junction AB. Sketch the variation of the shear-stress intensity over the entire cross section.

Module 2d: Lecture Problems

Example 3

The beam has a square cross-section and is made of wood having an allowable shear stress of 1.4 ksi. If it is subjected to a shear force of 1.5 kip, determine the smallest dimension a of its sides.

Module 2d: Lecture Problems

Example 4

The shaft is supported by a smooth thrust bearing at A and a smooth journal bearing at B. If $P=26$ kN, determine the absolute maximum shear and normal stress in the shaft.

Example 5

Determine the maximum shear stress and normal stress in the T-beam at the critical section where the internal shear force is maximum and the internal bending moment is maximum.

Module 2d: Lecture Problems

Kahoot Example

The pin support is made from a steel rod and has a diameter of 20 mm. Determine the stress at points A and B.

Module 2d: Lecture Problems

Example 6

The member shown has a rectangular cross section. Determine the state of stress that the loading produces at C and D.
